FDBA/HDBA Series
Standard UTE 93422

HE302, HE303, NFL54130 and EN3646

Introduction

1. Triple wire sealing.
2. Interfacial seal ensured by compression of insert and static/dynamic seal.
3. Contacts individual sealing at coupling stage by compression of elastomer conical risers on hard insert.
4. Anti-friction washers for constant mating force.
5. Insert to shell sealing with potting.
6. Connector rear part fitted with a teeth anti-rotation system assuming an effective tightening and clamping.

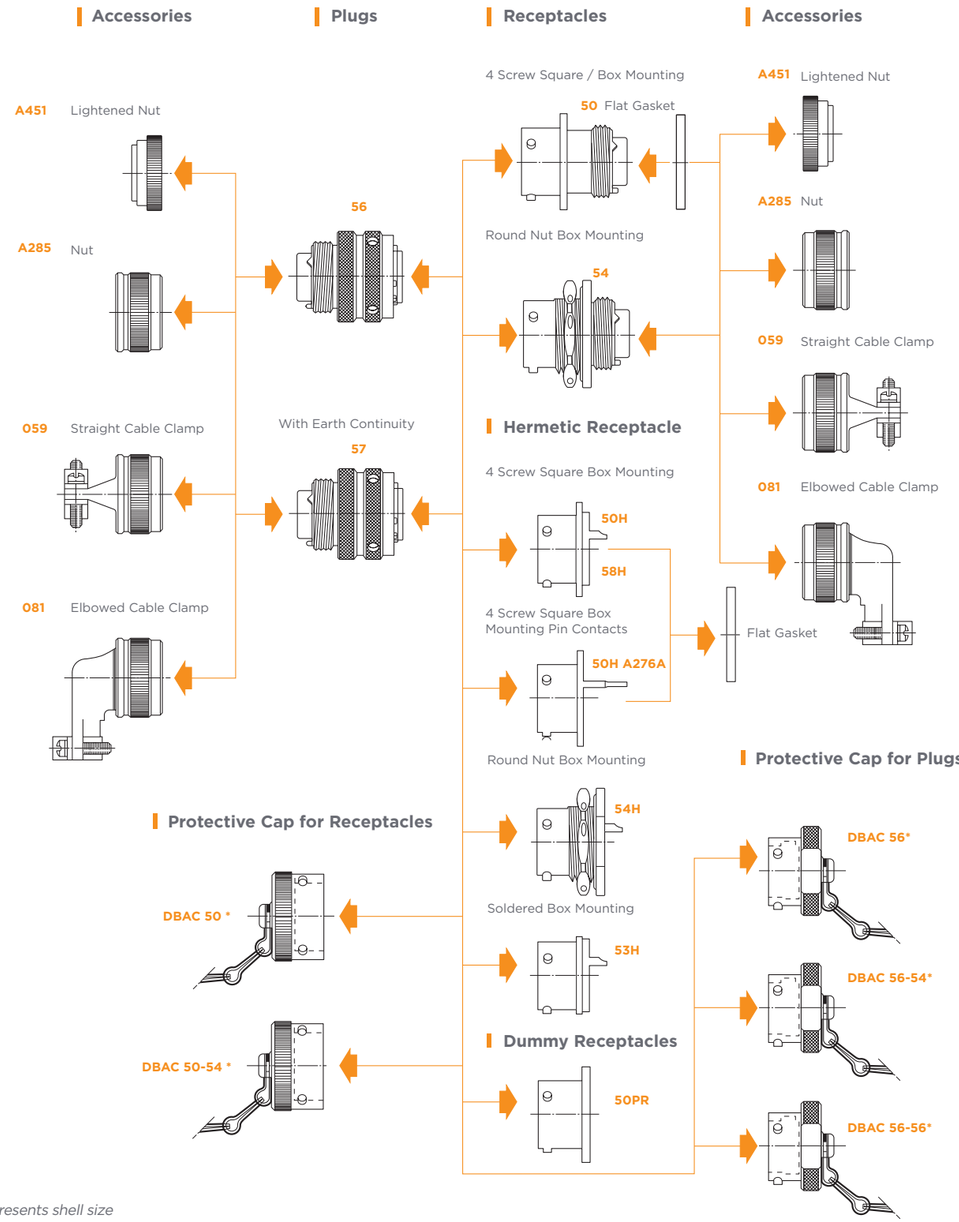

1. Bayonet coupling
2. Black Anodize, Nickel or Cadmium plated Aluminium shells. Hermetics are Nickel plated steel. Other plating options are available based on request.
3. Silicone elastomer and thermosetting resin insert. Silicone elastomer and sintered glass for hermetic.
4. RoHS (Restriction of Hazardous Substances)/REACH (Registration, Evaluation, Authorisation and Restriction of Chemicals) Compliant Black EN plating version option available in Aluminium shell.
5. Gain in weight (25%) and overall dimension (23%) compared to NAS 1599 connectors. Gain in weight (50%) for aluminium hermetic version compared to steel and stainless steel hermetic version.
6. Crimping contacts size 20, 16 and 12.
7. Solder contacts hermetic shells.
8. Contacts for printed circuit available in sealed and hermetic shells.
9. Back silicone insert on each wire to accept the new generation of aeronautic cables.
10. 9 sizes of shells and 27 arrangements available.

Normal clocking position

Key Orientation

Clocking position is normal when the insert vertical axis is intermingled with the shell keyway axis. An unkeying can be performed between 2 connectors of same layout by angular displacement of one of the inserts in its shell.

This insert rotation is made in the clockwise for pin layouts and in the counter clockwise for socket layouts. Angular displacements on the hereafter table give clocking positions W - X - Y - or Z (see table).
